## FEATURES and FUNCTIONAL DIAGRAM

- Enhanced sensitivity: will operate from only 30 Gauss typical, at 25°C allowing the use of smaller, potentially lower-cost magnets or wider air gaps
- Subminiature, SOT-23-3L(CH424S/CH424NS) or SOT-89-3L(CH424E/CH424NE) surface mount package supplied on tape and reel allows for a compact design with automated component placement, helping to reduce manufacturing costs
- Small, leaded, flat, TO-92S package (CH424T/CH424NT) allows for a compact PCB layout
- Bipolar latching magnetics respond to alternating North and South poles, making these products well-suited for accurate speed sensing and RPM (revolutions per minute) measurement
- Wide operating voltage range of 3.3V to 30V makes these sensors useable in a wide range of applications
- Built-in reverse voltage capability enhances the protection of the sensor and the circuits with which it is used
- Robust design: will operate up to 150 °C
- RoHS-compliant material meets directive 2011/65/EU

## PACKAGE

## APPLICATIONS

- Transportation
- Speed and RPM (revolutions per minute) sensing
  - Tachometer, counter pickup
  - Motor and fan control
  - Electric window lift
  - Convertible roof position
  - Automotive transmission position
- Industrial
- Speed and RPM sensing
  - Tachometer, counter pickup
  - Flow-rate sensing
  - Brushless dc (direct current) motor commutation
  - Motor and fan control
  - Robotics control
- Medical
- Motor assemblies
  - Medication dispense control

## DESCRIPTION

The CH424 and CH424N are small, versatile digital Hall effect devices that are operated by the magnetic field from a permanent magnet or an electromagnet, designed to respond to alternating North and South poles.

These bipolar latching sensor ICs have enhanced sensitivity, which often allows for the use of less expensive magnets.

These sensor ICs are available in three package styles, the CH424S/CH424NS in the subminiature SOT-23-3L surface mount package, the CH424E/CH424NE in the subminiature SOT-89-3L surface mount package, and the CH424T/CH424NT in the leaded, flat TO-92S package.

The CH424S/CH424NS and CH424E/CH424NE's small size requires less PC board space, allowing it to be used in smaller assemblies. Its 3.3V capability allows for use in low voltage applications, promoting energy efficiency.

The CH424S/CH424NS and CH424E/CH424NE are available on tape and reel; the CH424T/CH424NT is available in a bulk package (1000 units per bag).

#### 5. Function Description

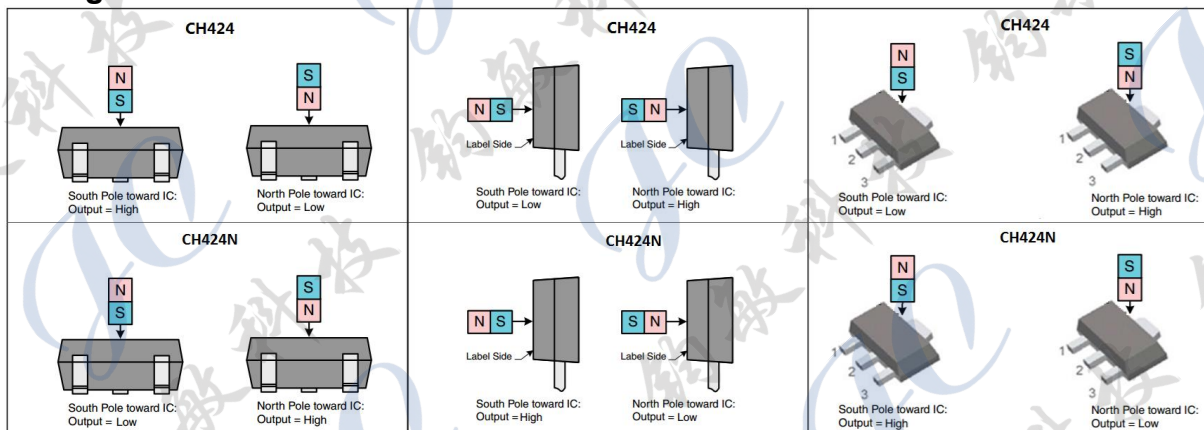

The CH424/CH424N exhibits latch magnetic switching characteristics. Therefore, it requires both south and north poles to operate properly.

The device behaves as a latch with symmetric operating and release switching points (BOP=|BRP|). This means magnetic fields with equivalent strength and opposite direction drive the output high and low.

Removing the magnetic field (B = 0) keeps the output in its previous state. This latching property defines the device as a magnetic memory.

A magnetic hysteresis BHYST keeps BOP and BRP separated by a minimal value. This hysteresis prevents output oscillation near the switching point.

**NOTICE**

Bipolar Hall-effect sensor ICs may have an initial output in either the ON or OFF state if powered up with an applied magnetic field in the differential zone (applied magnetic field >Brp and <Bop). Cosemitech recommends allowing 10 μs for output voltage to stabilize after supply voltage has reached 5V.

**NOTICE**

The magnetic field strength (Gauss) required to cause the switch to change state (operate and release) will be as specified in the magnetic characteristics. To test the switch against the specified magnetic characteristics, the switch must be placed in a uniform magnetic field.

9. Test Conditions

Note: DUT=Device Under Test

Supply Current

Note 1 - The supply current  $I_{DD}$  represents the static supply current. OUT is left open during measurement

Note 2 - The device is put under magnetic field with  $B < B_{BRP}$

Output Saturation Voltage

Note 1 - The output saturation voltage  $V_{DS(on)}$  is measured at  $V_{DD}=3.8V$  and  $V_{DD}=24V$

Note 2 - The device is put under magnetic field with  $B > B_{OP}$

Output Leakage Current

Note 1 - The device is put under magnetic field with  $B < B_{BRP}$

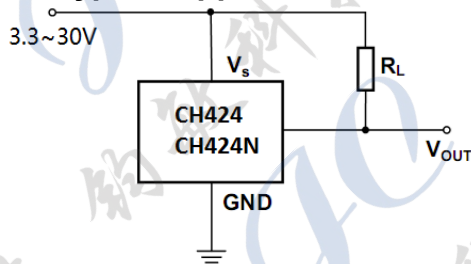

Magnetic Thresholds

Note 1 -  $B_{OP}$  is determined by putting the device under magnetic field swept from  $B_{BRPmin}$  up to  $B_{OPmax}$  until the output is switched on.

Note 2 -  $B_{RP}$  is determined by putting the device under magnetic field swept from  $B_{OPmax}$  down to  $B_{BRPmin}$  until the output is switched off.
